

Precision made visible.

Antropi Robotics customer-facing landing page redesign

Objective and audience

The redesign turns Antropi's operational strengths into a clear buying story: choose the precision, see the proof, then start the order. It is aimed at engineering and procurement teams who need confidence in repeatability, quality and delivery rather than broad manufacturing claims.

Decision hierarchy

The page opens with one direct promise: repeatable precision CNC parts. The content then moves through the 100 / 10 / 5 micron capability, inspection evidence, order visibility, repeat-order continuity and finally the CAD-upload action. This makes the information sequence follow the buyer's decision instead of the company's internal organization.

01 OUTCOME FIRST

Repeatability leads; autonomous-factory technology supports it.

02 SPECIFIC PROOF

Exact precision tiers and inspection artifacts replace generic quality language.

03 ONE PRIMARY ACTION

Every path resolves to uploading the customer's existing package.

04 RESPONSIVE + ACCESSIBLE

The 1440 px composition compresses for tablet and mobile, with readable type, keyboard focus, semantic tabs and reduced-motion support.

Trust shown as operational evidence

A live production-record card, an explicitly labelled sample inspection report and a direct job-shop comparison make the promise concrete. The claims stay within the brief: in-house inspection, traceability, clearer delivery expectations and repeat-order continuity.

Visual system

Graphite surfaces, square geometry, calibrated grid lines and monospaced labels reference metrology equipment and production records. Antropi violet is reserved for precision, progress and action. The machined-metal hero adds material reality without competing with the message.

Make the prototype useful, not decorative.

AI reduces technical uncertainty

The CNC part guide explains bearing housings, motor mounts and fluid manifolds in plain English. Gemini runs behind the server boundary. An eight-second timeout and curated component-specific fallback keep the interaction useful when the provider is unavailable. Final manufacturing decisions are explicitly deferred to the engineering drawing.

Functional architecture

Layer	Role
React landing page	Customer-facing interaction and responsive presentation
API gateway	Single public service surface for component, quote-intake and AI services
Component service	CNC component definitions and feature metadata
AI service	Gemini response with prompt guardrails and curated fallback
Quote service	Lightweight requirements validation and intake

Tools used

Design and build: React 19, Vinext, TypeScript, CSS, Lucide

AI and visual: Gemini Interactions API, OpenAI image generation

Services: Node.js microservices and Docker Compose

Brand assets: supplied Antropi Robotics logo files

Submission summary

The result is a desktop-led, responsive landing page that makes precision, evidence and repeatability the core story. The visual language supports the manufactured feel, while interaction is concentrated around one conversion path: uploading the customer's existing CAD package.

CORE PRODUCT SIGNAL	100 / 10 / 5 μm precision tiers
PRIMARY ACTION	Upload CAD / drawing / order package
PROOF	Inspection evidence, production record, repeat-order continuity
